

1. The security is so important in the internet because security is crucial when you send confidential information online
2. Mozilla Firefox displays a lock when the website is secure and allows you to disable or delete cookies
3. Banking services offer SSL, a protocol which provides secure transactions
4. The only way to protect a message is to put in a sort of virtual envelope, that is to encode it with some form of encryption. To send email privately is Pretty Good Privacy
5. The most common methods of protection are passwords for process control, firewalls and encryption and decryption systems
6. A virus can enter PC via a disc drive or via Internet
7. A worm is self-copying program that spreads through email attachments: it replicates itself and send a copy to everyone in an address book
